FedCET with Nonconvex Loss functions

- We provide the convergence of FedCET under nonconvex loss functions with deterministic and
- stochastic cases.
- **Theorem 1.** (Deterministic Case) Under Assumption 1, there exist stepsize α and the parameter $0 < c < \frac{2}{(\tau+3)\alpha}$ such that

$$\frac{1}{\tau K} \sum_{t=1}^{\tau K} \|\nabla f(\bar{x}(t))\|^2 \leq O(\frac{1}{\tau K}).$$

- 6 where $\bar{x}(t) = \frac{1}{N} \sum_{i=1}^{N} x_i(t)$ and K is the communication round of FedCET.
- 7 Proof. See Section 2.
- 8 **Theorem 2.** (Stochastic Case) Under Assumption 1, there exist stepsize α and the parameter 9 $0 < c < \frac{2}{(\tau+3)\alpha}$ such that

$$\frac{1}{\tau K} \sum_{t=1}^{\tau K} \mathbb{E} \left[\|\nabla f(\bar{x}(t))\|^2 \right] \le O(\frac{1}{\tau K}) + O(\tau \alpha \sigma^2).$$

- where $\bar{x}(t) = \frac{1}{N} \sum_{i=1}^{N} x_i(t)$ and K is the communication round of FedCET.
- *Proof.* See Section 3.

2 Proof of Theorem 1

To analyze the convergence of FedCET, we define:

$$\xi = c\alpha,$$

$$X(t) = [x_1(t), x_2(t), \cdots, x_N(t)],$$

$$\nabla f(X(t)) = [\nabla f_1(x_1(t)), \nabla f_2(x_2(t)), \cdots, \nabla f_N(x_N(t))],$$

$$\overline{X}(t) = \frac{1}{N} \sum_{i=1}^{N} x_i(t),$$

$$\overline{\nabla f}(X(t)) = \frac{1}{N} \sum_{i=1}^{N} \nabla f_i(x_i(t)),$$

$$W = \frac{1}{N} \mathbf{1}_N \mathbf{1}_N^T.$$

In addition, we define the time-varying mixing matrix

$$W(t) = \begin{cases} (1 - \xi)\mathbf{I}_N + \xi W, & t = k\tau, \\ \mathbf{I}_N, & t \neq k\tau \end{cases}$$
 (1)

to represent the local updates of FedCET equivalently. Thus, (2) and (3) can be equivalently represented as

$$X(t+1) = 2X(t)W(t) - X(t-1)W(t) - \alpha \nabla f(X(t))W(t) + \alpha \nabla f(X(t-1))W(t).$$
 (2)

From (2), we have

$$\overline{X}(t+1) = 2\overline{X}(t) - \overline{X}(t-1) - \alpha \overline{\nabla f}(X(t)) + \alpha \overline{\nabla f}(X(t-1)). \tag{3}$$

From (1) and (3), we have

$$\overline{X}(t+1) - \overline{X}(t)
= \overline{X}(t) - \overline{X}(t-1) - \alpha \{ \overline{\nabla f}(X(t)) - \overline{\nabla f}(X(t-1)) \}
= \overline{X}(0) - \overline{X}(-1) - \alpha \{ \overline{\nabla f}(X(t)) - \overline{\nabla f}(X(-1)) \}.$$
(4)

- For convenience, we consider the initial value setting of $x_i(-1)$ and $x_i(0)$, which should follow the
- rules: $x_i(-1)$ can be arbitrarily chosen in \mathbb{R}^n whereas $x_i(0)$ should be set as

$$x_i(0) = x_i(-1) - \alpha \nabla f_i(x_i(-1)).$$
 (5)

From (4) and the initial value setting (5), we can obtain

$$\overline{X}(t+1) = \overline{X}(t) - \alpha \overline{\nabla f}(X(t)). \tag{6}$$

From (6), Assumption 1, and the property $||a+b||^2 = ||a||^2 + ||b||^2 + 2\langle a,b\rangle$, we have

$$f(\overline{X}(t+1))$$

$$\leq f(\overline{X}(t)) - \alpha \langle \nabla f(\overline{X}(t)), \overline{\nabla f}(X(t)) \rangle + \frac{L\alpha^2}{2} \|\overline{\nabla f}(X(t))\|^2
= f(\overline{X}(t)) - \frac{\alpha}{2} \|\nabla f(\overline{X}(t))\|^2 - (\frac{\alpha}{2} - \frac{L\alpha^2}{2}) \|\overline{\nabla f}(X(t))\|^2 + \frac{\alpha}{2} \|\nabla f(\overline{X}(t)) - \overline{\nabla f}(X(t))\|^2
\leq f(\overline{X}(t)) - \frac{\alpha}{2} \|\nabla f(\overline{X}(t))\|^2 - (\frac{\alpha}{2} - \frac{L\alpha^2}{2}) \|\overline{\nabla f}(X(t))\|^2 + \frac{\alpha L^2}{2N} \sum_{i=1}^{N} \|\overline{X}(t) - x_i(t)\|^2.$$
(7)

Thus, from (7), we have

$$\sum_{t=1}^{T} \{ \|\nabla f(\overline{X}(t))\|^{2} + (1 - L\alpha) \|\overline{\nabla f}(X(t))\|^{2} \}
\leq \frac{2}{\alpha} \{ f(\overline{X}(1)) - f(x^{*}) \} + \frac{L^{2}}{N} \sum_{t=1}^{T} \sum_{i=1}^{N} \|\overline{X}(t) - x_{i}(t)\|^{2}.$$
(8)

- From (8), it is necessary to analyze the consensus error $\sum_{t=1}^T \sum_{i=1}^N \|\overline{X}(t) x_i(t)\|^2$ before establishing the convergence rate of FedCET. We define $\widetilde{W} = (1 \xi)\mathbf{I}_N + \xi W$ and thus eigenvalues
- $\{\rho_1, \rho_2, \cdots, \rho_N\}$ of W satisfies

$$\rho_i = 1 - \xi + \xi \lambda_i,$$

where

$$\lambda_i = \begin{cases} 1, & i = 1, \\ 0, & 2 \le i \le N, \end{cases} \tag{9}$$

are eigenvalues of W. From the definition $\xi = c\alpha$ and $0 < c < \frac{2}{(\tau + 3)\alpha}$, we have

$$\rho_1 = 1, \quad \frac{\tau - 1}{\tau + 3} < \rho_i < 1, \quad \text{for } i = 2, 3, \dots, N.$$
(10)

- From (1), W(t) can be equivalently represented via an orthogonal matrix $P = [v_1, v_2, \cdots, v_N] \in \mathbb{R}^{N \times N}$ satisfying $P^{\mathbf{T}}P = PP^{\mathbf{T}} = \mathbf{I}_N$ and a diagonal matrix $\Lambda(t) = \operatorname{diag}\{\rho_1(t), \rho_2(t), \cdots, \rho_N(t)\}$
- as follows:

$$W(t) = P\Lambda(t)P^{\mathbf{T}},\tag{11}$$

where $\rho_i(t) = \rho_i$ for $t = k\tau$ and $\rho_i(t) = 1$ for $t \neq k\tau$. Moreover, if we define

$$\begin{cases} Y(t) = X(t)P = [y_1(t), y_2(t), \cdots, y_N(t)], \\ H(t) = \overline{\nabla f}(X(t))P = [h_1(t), h_2(t), \cdots, h_N(t)], \end{cases}$$
(12)

from (2) and (11), we have

$$Y(t+1) = 2Y(t)\Lambda(t) - Y(t-1)\Lambda(t) - \alpha H(t)\Lambda(t) + \alpha H(t-1)\Lambda(t). \tag{13}$$

Moreover, from (12) and (13), we have

$$y_i(t+1) = \rho_i(t)(2y_i(t) - y_i(t-1) - \alpha h_i(t) + \alpha h_i(t-1)), \tag{14}$$

for $i=1,2,\cdots,N$. We denote the n-dimensional unit vector set as $\{e_i\}_{i=1,2,\cdots,n}$, where $[e_i]_j=1$ for j=i and $[e_i]_j=0$ for $j\neq i$. Then, we present the relationship between $y_i(t)$ and $\overline{X}(t)-x_i(t)$

$$\sum_{i=1}^{N} \|\overline{X}(t) - x_{i}(t)\|^{2}$$

$$= \sum_{i=1}^{N} \|X(t)e_{i} - \frac{1}{N}X(t)\mathbf{1}_{N}\|^{2}$$

$$= \|X(t)v_{1}v_{1}^{\mathbf{T}} - X(t)PP^{\mathbf{T}}\|_{F}^{2}$$

$$= \|X(t)P(\mathbf{I}_{N} - [e_{1}, \mathbf{0}_{N}, \dots, \mathbf{0}_{N}])P^{\mathbf{T}}\|_{F}^{2}$$

$$= \sum_{i=2}^{N} \|y_{i}(t)\|^{2}.$$
(15)

Thus, obtaining an analytical expression for $y_i(t)$ from the recursive formula (14) is key to establishing

the consensus property of FedCET. To address this, we introduce Lemma 1.

40 **Lemma 1.** The recursive sequence $\{a(t)\}_{t=0}^{\infty}$ satisfying

$$a(t+1) = \rho(t)(2a(t) - a(t-1) + b(t) - b(t-1)), \tag{16}$$

with initial values a(0) and a(1), where

$$\rho(t) = \begin{cases} \rho, & t = k\tau, \\ 1, & t \neq k\tau, \end{cases}$$
 (17)

42 for any $\frac{\tau-1}{\tau+3}<\rho<1$, $k\in\mathbb{Z}$ and $1\leq p\leq \tau$, we have

$$a(k\tau + p) = pa(k\tau + 1) - (p-1)a(k\tau) + \sum_{h=1}^{p-1} \sum_{j=1}^{h} \{b(k\tau + j) - b(k\tau + j - 1)\},$$
 (18)

$$a(k\tau+1) = (\sqrt{\rho})^k (F_{11}(k)a(1) + F_{12}(k)a(0)) + \sum_{s=0}^{k-1} (\sqrt{\rho})^{k-1-s} \{ F_{11}(k-1-s)G_{11}(s) + F_{12}(k-1-s)G_{21}(s) \},$$
(19)

$$a(k\tau) = (\sqrt{\rho})^k (F_{21}(k)a(1) + F_{22}(k)a(0)) + \sum_{s=0}^{k-1} (\sqrt{\rho})^{k-1-s} \{ F_{21}(k-1-s)G_{11}(s) + F_{22}(k-1-s)G_{21}(s) \},$$
(20)

where
$$\cos(\theta) = \frac{\rho(\tau+1)+1-\tau}{2\sqrt{\rho}}$$
, $\sin(\theta) = \frac{\sqrt{4\rho-[\rho(\tau+1)+(1-\tau)]^2}}{2\sqrt{\rho}}$,
$$F_{11}(s) = \frac{\sin[(s+1)\theta]}{\sin[\theta]} + \frac{(\tau-1)\sin[s\theta]}{\sqrt{\rho}\sin[\theta]},$$

$$F_{12}(s) = -\frac{\tau\sqrt{\rho}\sin[s\theta]}{\sin[\theta]}, \quad F_{21}(s) = \frac{\tau\sin[s\theta]}{\sqrt{\rho}\sin[\theta]},$$

$$F_{22}(s) = -\frac{\sin[(s-1)\theta]}{\sin[\theta]} - \frac{(\tau-1)\sin[s\theta]}{\sqrt{\rho}\sin[\theta]},$$

$$G_{11}(s) = \rho \sum_{\substack{j=1 \ \tau}}^{r} j[b(s\tau + \tau + 1 - j) - b(s\tau + \tau - j)],$$

$$G_{21}(s) = \sum_{j=1}^{\tau} (j-1)[b(s\tau + \tau + 1 - j) - b(s\tau + \tau - j)].$$

44 *Proof.* The recursive fomula (16) can be equivalently expressed as the following matrix form:

$$x(t+1) = A(t)x(t) + B(t)u(t), (21)$$

45 where

46

50

51

$$x(t) = \begin{bmatrix} a(t) \\ a(t-1) \end{bmatrix}, \quad A(t) = \begin{bmatrix} 2\rho(t) & -\rho(t) \\ 1 & 0 \end{bmatrix},$$
$$u(t) = \begin{bmatrix} b(t) \\ b(t-1) \end{bmatrix}, \quad B(t) = \begin{bmatrix} \rho(t) & -\rho(t) \\ 0 & 0 \end{bmatrix}.$$

From the lifting methods introduced in [1], the periodic system (21) can be equivalently expressed as

48 the following time-invariant system

$$x((k+1)\tau + 1) = F_1x(k\tau + 1) + G_1u_1(k), \tag{22}$$

49 where

$$G_{1} = [C(1), \cdots, C(j), \cdots, C(\tau)] \in \mathbb{R}^{2 \times 2\tau},$$

$$u_{1}(k) = \left[u^{\mathbf{T}}(k\tau+1), u^{\mathbf{T}}(k\tau+2), \cdots, u^{\mathbf{T}}(k\tau+\tau)\right]^{\mathbf{T}} \in \mathbb{R}^{2\tau}$$

$$F_{1} = \prod_{i=0}^{\tau-1} A(\tau-i) = \begin{bmatrix} \rho(\tau+1) & -\rho\tau \\ \tau & -\tau+1 \end{bmatrix} \in \mathbb{R}^{2 \times 2},$$

$$C(j) = \begin{bmatrix} \rho(\tau-j+1) & -\rho(\tau-j+1) \\ \tau-j & j-\tau \end{bmatrix} \in \mathbb{R}^{2 \times 2}.$$

52 From (22), we have

$$x(k\tau + 1) = F_1^k x(1) + \sum_{s=0}^{k-1} F_1^{k-1-s} G_1 u_1(s).$$
(23)

Then, we establish the properties of F_1^s and $G_1u_1(s)$ for $s=1,2,\cdots,k$ in Lemma 2 (see proof in

54 Appendix 2.1).

Lemma 2. For $s=1,2,\cdots,k$, the matrices F_1^s and $G_1u_1(s)$ in (23) satisfy

$$F_1^s = \rho^{\frac{s}{2}} \left[\begin{array}{cc} F_{11}(s) & F_{12}(s) \\ F_{21}(s) & F_{22}(s) \end{array} \right], \quad G_1 u_1(s) = \left[\begin{array}{cc} G_{11}(s) \\ G_{21}(s) \end{array} \right],$$

56 where $F_{11}(s)$, $F_{12}(s)$, $F_{21}(s)$, $F_{22}(s)$, $G_{11}(s)$, and $G_{21}(s)$, are defined in Lemma 1.

57 From (23) and Lemma 2, we have

$$\begin{bmatrix} a(k\tau+1) \\ a(k\tau) \end{bmatrix} = (\sqrt{\rho})^k \begin{bmatrix} F_{11}(k) & F_{12}(k) \\ F_{21}(k) & F_{22}(k) \end{bmatrix} \begin{bmatrix} a(1) \\ a(0) \end{bmatrix} + \sum_{s=0}^{k-1} (\sqrt{\rho})^{k-1-s} \begin{bmatrix} F_{11}(k-1-s)G_{11}(s) + F_{12}(k-1-s)G_{21}(s) \\ F_{21}(k-1-s)G_{11}(s) + F_{22}(k-1-s)G_{21}(s) \end{bmatrix}.$$

Thus, (19) and (20) in Lemma 1 can be obtained from the above matrix equation. From (16) and (17),

59 we have

$$a(k\tau + p) - a(k\tau + p - 1)$$

$$= a(k\tau + p - 1) - a(k\tau + p - 2) + b(k\tau + p - 1) - b(k\tau + p - 2)$$

$$= a(k\tau + 1) - a(k\tau) + \sum_{j=1}^{p-1} \{b(k\tau + j) - b(k\tau + j - 1)\}.$$

for $1 \le p \le \tau$. Thus, we have

$$a(k\tau + p) - a(k\tau + 1) = (p-1)\{a(k\tau + 1) - a(k\tau)\} + \sum_{h=1}^{p-1} \sum_{i=1}^{h} \{b(k\tau + j) - b(k\tau + j - 1)\}.$$

The proof of Lemma 1 is completed.

From (10) and Lemma 1, we can derive the analytical expression for $y_i(t)$ from the recursive formula (14). Thus, for 2 < i < N, we have

$$||y_{i}(k\tau+1)|| \leq \alpha(\rho\tau+\tau-1)A_{1}\sum_{s=0}^{k-1}(\sqrt{\rho})^{k-1-s}\{\sum_{j=1}^{\tau}||h_{i}(\tau s+1+\tau-j)-h_{i}(\tau s+\tau-j)||\} + A_{1}A_{2}(\sqrt{\rho})^{k},$$

$$(24)$$

$$||y_{i}(k\tau+1)-y_{i}(k\tau)|| \leq \alpha(\rho\tau+\tau-1)A_{3}\sum_{s=0}^{k-1}(\sqrt{\rho})^{k-1-s}\{\sum_{i=1}^{\tau}||h_{i}(s\tau+\tau+1-j)-h_{i}(s\tau+\tau-j)||\} + A_{3}A_{2}(\sqrt{\rho})^{k},$$

64 where

$$\begin{split} & \rho = 1 - \xi, \\ & A_1 = \frac{2\tau}{\sqrt{4\rho - [\rho(\tau + 1) + 1 - \tau]^2}}, \\ & A_2 = \max_{2 \le i \le N} \{\|y_i(1)\| + \|y_i(0)\|\}, \\ & A_3 = \max \{\frac{2\sqrt{\rho} + 2}{\sqrt{4\rho - [\rho(\tau + 1) + (1 - \tau)]^2}}, \frac{2\sqrt{\rho}}{\sqrt{4\rho - [\rho(\tau + 1) + (1 - \tau)]^2}} (1 + |\tau\sqrt{\rho} - \frac{\tau - 1}{\sqrt{\rho}}|)\}. \end{split}$$

65 From Lemma 1, (24), and (25), we have

$$||y_{i}(k\tau+p)||$$

$$\leq ||y_{i}(k\tau+1)|| + (p-1)||y_{i}(k\tau+1) - y_{i}(k\tau)|| + \alpha \sum_{h=1}^{p-1} \sum_{j=1}^{h} ||h_{i}(k\tau+j) - h_{i}(k\tau+j-1)||$$

$$\leq pA_{4}A_{2}(\sqrt{\rho})^{k} + \alpha \sum_{h=1}^{p-1} \sum_{j=1}^{h} ||h_{i}(k\tau+j) - h_{i}(k\tau+j-1)||$$

$$+ A_{4}p\alpha(\rho\tau+\tau-1) \sum_{s=1}^{k} (\sqrt{\rho})^{k-s} \sum_{j=1}^{\tau} ||h_{i}(s\tau-j) - h_{i}(s\tau+1-j)||,$$
(26)

where $A_4 = \max\{A_1, A_3\}$ and $1 \le p \le \tau$. In FedCET, we consider the K+1 communication rounds and the total iteration times satisfy $T = \tau + K\tau$. Thus, we have

$$\sum_{t=1}^{T} \|y_i(t)\|^2 = \sum_{k=0}^{K} \sum_{p=1}^{\tau} \|y_i(k\tau + p)\|^2.$$
 (27)

(25)

From (26) and (27), we can obtain the upper bound of $\sum_{t=1}^{T} ||y_i(t)||^2$, which is presented in Lemma

70 **Lemma 3.** There exist $B_2=3\tau^4+\frac{\tau^2(\tau+1)(2\tau+1)(\rho\tau+\tau-1)^2}{2(1-\sqrt{\rho})^2}A_4^2$ and $B_1=\frac{\tau(\tau+1)(2\tau+1)}{2(1-\rho)}A_4^2A_2^2$ such that

$$\sum_{t=1}^{T} \|y_i(t)\|^2 \le B_1 + \alpha^2 B_2 \sum_{t=1}^{T-1} \|h_i(t) - h_i(t-1)\|^2.$$

72 In addition, we also have

$$\sum_{i=2}^{N} \|h_i(t-1) - h_i(t)\|^2 \le L^2 \sum_{i=1}^{N} \|y_i(t) - y_i(t-1)\|^2.$$

- For clarity and readability, we provide the detailed proof of Lemma 3 in the Appendix 2.2. From
- Lemma 3, we have

$$\sum_{i=2}^{N} \sum_{t=1}^{T} \|y_i(t)\|^2 \le NB_1 + \alpha^2 L^2 B_2 \sum_{t=1}^{T-1} \sum_{i=1}^{N} \|y_i(t) - y_i(t-1)\|^2.$$
 (28)

Then, we need to analyze $||y_1(t)-y_1(t-1)||^2$. We have $y_1(t)=X(t)Pe_1=X(t)v_1=0$ $\frac{1}{\sqrt{N}}X(t)\mathbf{1}_N=\sqrt{N}\overline{X}(t)$. Thus, from (6), we have

$$||y_1(t+1) - y_1(t)||^2 \le N\alpha^2 ||\overline{\nabla f}(X(t))||^2.$$
 (29)

From (28) and (29), we have

$$\sum_{i=2}^{N} \sum_{t=1}^{T} \|y_{i}(t)\|^{2}$$

$$\leq NB_{1} + \alpha^{2}L^{2}B_{2} \sum_{t=1}^{T-1} \sum_{i=1}^{N} \|y_{i}(t) - y_{i}(t-1)\|^{2}$$

$$\leq NB_{1} + 4\alpha^{2}L^{2}B_{2} \sum_{t=1}^{T-1} \sum_{i=2}^{N} \|y_{i}(t)\|^{2} + 2\alpha^{2}L^{2}B_{2}NA_{2}^{2} + \alpha^{4}L^{2}NB_{2} \sum_{t=1}^{T-1} \|\overline{\nabla f}(X(t-1))\|^{2}$$

$$\leq C_{1} + \alpha^{2}L^{2}B_{2} \sum_{t=1}^{T-1} \left\{ 4 \sum_{i=2}^{N} \|y_{i}(t)\|^{2} + \alpha^{2}N \|\overline{\nabla f}(X(t))\|^{2} \right\}.$$

where $C_1 = \alpha^2 L^2 N B_2(\alpha^2 || \overline{\nabla f}(X(0)) ||^2 + 2A_2^2) + N B_1$. Combining with (15), we have

$$(1 - 4\alpha^2 L^2 B_2) \sum_{i=1}^{N} \sum_{t=1}^{T} \|\overline{X}(t) - x_i(t)\|^2 \le C_1 + \alpha^4 L^2 N B_2 \sum_{t=1}^{T-1} \|\overline{\nabla f}(X(t))\|^2, \tag{30}$$

- Thus, we obtain the property of the consensus error $\sum_{i=1}^{N} \sum_{t=1}^{T} \|\overline{X}(t) x_i(t)\|^2$ in (30), which will be utilized to prove the convergence rate of FedCET.
- If the stepsize α satisfies $B_3 = 1 4\alpha^2 L^2 B_2 > 0$, from (8) and (30), we have

$$\sum_{t=1}^{T} \{ \|\nabla f(\overline{X}(t))\|^{2} + (1 - L\alpha - \frac{\alpha^{4}L^{4}B_{2}}{B_{3}}) \|\overline{\nabla f}(X(t))\|^{2} \}
\leq \frac{2}{\alpha} \{ f(\overline{X}(1)) - f(x^{*}) \} + \frac{C_{1}L^{2}}{B_{3}N}.$$
(31)

As for the stepsize $0 < \alpha \le \frac{1}{\sqrt{5B_2}L}$, we have $1 - L\alpha - \frac{\alpha^4 L^4 B_2}{B_3} > 0$. Thus, from (31), we have

$$\frac{1}{T} \sum_{t=1}^{T} \|\nabla f(\overline{X}(t))\|^2 \le \frac{2}{\tau \alpha K} \{f(\overline{X}(1)) - f(x^*)\} + \frac{C_1 L^2}{B_3 N \tau K}.$$
 (32)

Then, we need to analyze the term $\frac{C_1L^2}{B_3N(\tau+1)}$ in (32).

$$\frac{C_1 L^2}{B_3 N \tau} \leq \frac{\alpha^2 L^4 B_2(\alpha^2 \|\overline{\nabla f}(X(0))\|^2 + 2A_2^2) + B_1 L^2}{B_3 \tau} \\
\leq \frac{\alpha^2 L^4 B_2(\alpha^2 \|\overline{\nabla f}(X(0))\|^2 + 2A_2^2)}{B_3 \tau} + \frac{B_1 L^2}{B_3 \tau}.$$
(33)

From the stepsize $0 < \alpha \le \frac{1}{\sqrt{5B_0}L}$, we have $B_3 = 1 - 4\alpha^2 L^2 B_2 \ge \alpha^2 L^2 B_2$. Thus, we have

$$\frac{B_2}{B_3} \le \frac{1}{\alpha^2 L^2},\tag{34}$$

 $\text{85} \quad \text{In addition, we also have } A_2^2 \leq 2\|X(0)\|_F^2 + 2\|X(1)\|_F^2, \ B_2 = 3\tau^4 + \frac{\tau^2(\tau+1)(2\tau+1)(\rho\tau+\tau-1)^2A_4^2}{2(1-\sqrt{\rho})^2}$

and $B_1 = \frac{\tau(\tau+1)(2\tau+1)A_4^2A_2^2}{2(1-\rho)}$. We have

$$B_2 \ge \frac{\rho^2 \tau^4 (\tau + 1)(2\tau + 1) A_4^2}{2(1 - \sqrt{\rho})^2}.$$

Thus, from (34), we have

$$\begin{split} \frac{B_1}{B_3} &\leq \frac{1}{\alpha^2 L^2} \frac{B_1}{B_2} \\ &\leq \frac{1}{\alpha^2 L^2} \frac{2(1 - \sqrt{\rho})^2 \tau(\tau + 1)(2\tau + 1) A_4^2 A_2^2}{2(1 - \rho)\rho^2 \tau^4 (\tau + 1)(2\tau + 1) A_4^2} \\ &\leq \frac{2\|X(0)\|_F^2 + 2\|X(1)\|_F^2}{\alpha^2 L^2 \rho^2 \tau^3}. \end{split} \tag{35}$$

88 From (32), (33), (34), (35), and the stepsize $0 < \alpha \le \frac{1}{\sqrt{5B_2}L}$, we have

$$\begin{split} &\frac{1}{T}\sum_{t=1}^{T}\|\nabla f(\overline{X}(t))\|^2\\ \leq &\frac{2}{\tau\alpha K}\{f(\overline{X}(1))-f(x^*)\} + \frac{\|\overline{\nabla f}(X(0))\|^2}{\tau^3 K}\\ &+\frac{4\|X(0)\|_F^2+4\|X(1)\|_F^2}{\tau^3\alpha^2 K} + \frac{2\|X(0)\|_F^2+2\|X(1)\|_F^2}{\alpha^2\rho^2\tau^4 K}, \end{split}$$

where $T = \tau K + \tau$. The proof of Theorem 1 is completed.

90 2.1 Proof of Lemma 2

The eigenvalues λ_1 and λ_2 of the matrix F_1 satisfy

$$\lambda^2 - [\rho(\tau + 1) + (1 - \tau)]\lambda + \rho = 0. \tag{36}$$

As for the quadratic equation (36), we have

$$[\rho(\tau+1) + (1-\tau)]^2 - 4\rho < 0,$$

since the parameter ρ satisfies $\rho > \frac{\tau - 1}{\tau + 3}$. Thus, eigenvalues λ_1 and λ_2 are

$$\lambda_1 = \frac{\rho(\tau+1) + (1-\tau)}{2} + \frac{\sqrt{4\rho - [\rho(\tau+1) + (1-\tau)]^2}}{2}i$$
$$\lambda_2 = \frac{\rho(\tau+1) + (1-\tau)}{2} - \frac{\sqrt{4\rho - [\rho(\tau+1) + (1-\tau)]^2}}{2}i.$$

Thus, λ_1 and λ_2 can be expressed as

$$\lambda_1 = \sqrt{\rho} \{\cos(\theta) + \sin(\theta)i\}, \ \lambda_2 = \sqrt{\rho} \{\cos(\theta) + \sin(-\theta)i\},$$

95 where

$$\begin{cases}
\sin(\theta) = \frac{\sqrt{4\rho - [\rho(\tau+1) + (1-\tau)]^2}}{2\sqrt{\rho}}, \\
\cos(\theta) = \frac{\rho(\tau+1) + 1 - \tau}{2\sqrt{\rho}}.
\end{cases} (37)$$

Moreover, from Euler's formula, we have eigenvalues $\lambda_1=\sqrt{\rho}e^{i\theta}$ and $\lambda_2=\sqrt{\rho}e^{-i\theta}$ with the corresponding eigenvector

$$v_1 = \begin{bmatrix} \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{\tau} \\ 1 \end{bmatrix}, \quad v_2 = \begin{bmatrix} \frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{\tau} \\ 1 \end{bmatrix}.$$

98 Thus, we can obtain

$$F_1^s = \begin{bmatrix} v_1, v_2 \end{bmatrix} \left[\begin{array}{cc} \lambda_1^s & 0 \\ 0 & \lambda_2^s \end{array} \right] [v_1, v_2]^{-1}$$

99 for any $s = 0, 1, \dots, k$, where

$$[v_1, v_2]^{-1} = \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \begin{bmatrix} 1 & -\frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{\tau} \\ -1 & \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{\tau} \end{bmatrix}.$$

Then, we know that for any $s \ge 0$, we have

$$\begin{split} F_1^s = & [v_1, v_2] \begin{bmatrix} \lambda_1^s & 0 \\ 0 & \lambda_2^s \end{bmatrix} [v_1, v_2]^{-1} \\ = & \frac{-i\tau(\sqrt{\rho})^s}{2\sqrt{\rho}\sin(\theta)} \begin{bmatrix} \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{1} & \frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{1} \\ 1 & 1 \end{bmatrix} \begin{bmatrix} e^{s\theta i} & 0 \\ 0 & e^{-s\theta i} \end{bmatrix} \begin{bmatrix} 1 & -\frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{\sqrt{\rho}e^{i\theta} + \tau - 1} \\ -1 & \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{\tau} \end{bmatrix} \\ = & \frac{-i\tau(\sqrt{\rho})^s}{2\sqrt{\rho}\sin(\theta)} \begin{bmatrix} \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{1} & \frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{1} \\ 1 & 1 \end{bmatrix} \begin{bmatrix} e^{s\theta i} & -\frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{\tau}e^{s\theta i} \\ -e^{-s\theta i} & \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{\tau}e^{-s\theta i} \end{bmatrix} \\ = & (\sqrt{\rho})^s \begin{bmatrix} F_{11}(s) & F_{12}(s) \\ F_{21}(s) & F_{22}(s) \end{bmatrix}. \end{split}$$

101 As for the $(1,1)^{th}$ element of F_1^s , we have

$$\begin{split} &F_{11}(s) \\ &= \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \left\{ \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{\tau} e^{s\theta i} - \frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{\tau} e^{-s\theta i} \right\} \\ &= \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \left\{ \frac{\sqrt{\rho}}{\tau} (e^{i(s+1)\theta} - e^{-i(s+1)\theta}) + \frac{\tau - 1}{\tau} (e^{is\theta} - e^{-is\theta}) \right\} \\ &= \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \left\{ \frac{2\sqrt{\rho}}{\tau} i \sin[(s+1)\theta] + \frac{2(\tau - 1)}{\tau} i \sin[s\theta] \right\} \\ &= \frac{\sin[(s+1)\theta]}{\sin[\theta]} + \frac{(\tau - 1)\sin[s\theta]}{\sqrt{\rho}\sin[\theta]} \end{split}$$

As for the $(2,1)^{th}$ element of F_1^s , we have

$$F_{21}(s) = \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \{e^{s\theta i} - e^{-s\theta i}\} = \frac{\tau\sin[s\theta]}{\sqrt{\rho}\sin[\theta]}.$$

As for the $(2,2)^{th}$ element of F_1^s , we have

$$\begin{split} &F_{22}(s) \\ &= \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \Big\{ \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{\tau} e^{-s\theta i} - \frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{\tau} e^{s\theta i} \Big\} \\ &= \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \Big\{ \frac{\sqrt{\rho}}{\tau} (e^{-i(s-1)\theta} - e^{i(s-1)\theta}) + \frac{\tau - 1}{\tau} (e^{-is\theta} - e^{is\theta}) \Big\} \\ &= \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \Big\{ - \frac{2\sqrt{\rho}}{\tau} i \sin[(s-1)\theta] - \frac{2(\tau - 1)}{\tau} i \sin[s\theta] \Big\} \\ &= -\frac{\sin[(s-1)\theta]}{\sin[\theta]} - \frac{(\tau - 1)\sin[s\theta]}{\sqrt{\rho}\sin[\theta]} \end{split}$$

104 As for the $(1,2)^{th}$ element of F_1^s , from (37), we have

$$\begin{split} &F_{12}(s) \\ &= \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \Big\{ \frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{\tau} \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{\tau} e^{-s\theta i} - \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{\tau} \frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{\tau} e^{s\theta i} \Big\} \\ &= \frac{-i\tau}{2\sqrt{\rho}\sin(\theta)} \Big\{ - \frac{\sqrt{\rho}e^{-i\theta} + \tau - 1}{\tau} \frac{\sqrt{\rho}e^{i\theta} + \tau - 1}{\tau} 2i\sin[s\theta] \Big\} \\ &= -\frac{\sin(s\theta)}{\tau\sqrt{\rho}\sin(\theta)} \Big((\tau - 1 + \sqrt{\rho}\cos[\theta])^2 + \rho\sin^2[\theta] \Big) \\ &= -\frac{\sin(s\theta)}{\tau\sqrt{\rho}\sin(\theta)} \Big((\tau - 1)^2 + 2\sqrt{\rho}\cos[\theta](\tau - 1) + \rho \Big) \\ &= -\frac{\sqrt{\rho}\tau\sin(s\theta)}{\sin(\theta)}. \end{split}$$

Based on the definition of G_1 and $u_1(s)$, we can obtain

$$G_{11}(s) = \rho \sum_{j=1}^{\tau} j[b(s\tau + \tau + 1 - j) - b(s\tau + \tau - j)],$$

$$G_{21}(s) = \sum_{j=1}^{\tau} (j-1)[b(s\tau + \tau + 1 - j) - b(s\tau + \tau - j)].$$

The proof of Lemma 2 is completed.

107 2.2 Proof of Lemma 3

108 From (26), we have

$$||y_{i}(k\tau+p)||^{2}$$

$$\leq 3p^{2}A_{4}^{2}A_{2}^{2}\rho^{k} + 3\alpha^{2}\left(\sum_{h=1}^{p-1}\sum_{j=1}^{h}||h_{i}(k\tau+j) - h_{i}(k\tau+j-1)||\right)^{2}$$

$$+ 3A_{4}^{2}p^{2}\alpha^{2}(\rho\tau+\tau-1)^{2}\left(\sum_{s=1}^{k}(\sqrt{\rho})^{k-s}\sum_{j=1}^{\tau}||h_{i}(s\tau+1-j) - h_{i}(s\tau-j)||\right)^{2}.$$
 (38)

Then, we need the following lemma from [2] to analyze the three terms of $\sum_{t=1}^{T} \|y_i(t)\|^2 = \sum_{k=0}^{K} \sum_{p=1}^{\tau} \|y_i(k\tau+p)\|^2$ in (38).

111 **Lemma 4** ([2]). For two non-negative sequences $\{a(t)\}_{t=1}^{\infty}$ and $\{b(t)\}_{t=1}^{\infty}$ satisfying a(t)=112 $\sum_{s=1}^{t} \rho^{t-s}b(s)$ with $0 \le \rho < 1$, we have

$$\sum_{t=s}^k a(t) \le \sum_{t=s}^k \frac{b(s)}{1-\rho}, \qquad \sum_{t=s}^k a^2(t) \le \sum_{t=s}^k \frac{b^2(s)}{(1-\rho)^2}.$$

It is worth noting that $\sum_{p=1}^{\tau} p^2 = \frac{\tau(\tau+1)(2\tau+1)}{6}$. Thus, as for the first term of (38), we have

$$\sum_{k=0}^{K} \sum_{n=1}^{\tau} 3p^2 A_4^2 A_2^2 \rho^k \le \frac{\tau(\tau+1)(2\tau+1)A_4^2 A_2^2}{2(1-\rho)}.$$
 (39)

As for the second term of (38), we have

$$\sum_{k=0}^{K} \sum_{p=1}^{\tau} \alpha^{2} (\sum_{h=1}^{p-1} \sum_{j=1}^{h} \|h_{i}(k\tau+j) - h_{i}(k\tau+j-1)\|)^{2}$$

$$\leq \alpha^{2} \sum_{k=0}^{K} \sum_{p=1}^{\tau} (\sum_{h=1}^{\tau-1} \sum_{j=1}^{h} \|h_{i}(k\tau+j) - h_{i}(k\tau+j-1)\|)^{2}$$

$$\leq \alpha^{2} \tau^{2} \sum_{k=0}^{K} \sum_{p=1}^{\tau} (\sum_{j=1}^{\tau-1} \|h_{i}(k\tau+j) - h_{i}(k\tau+j-1)\|)^{2}$$

$$\leq \alpha^{2} \tau^{3} \sum_{k=0}^{K} (\sum_{j=1}^{\tau-1} \|h_{i}(k\tau+j) - h_{i}(k\tau+j-1)\|)^{2}$$

$$\leq \alpha^{2} \tau^{4} \sum_{k=0}^{K} \sum_{j=1}^{\tau-1} \|h_{i}(k\tau+j) - h_{i}(k\tau+j-1)\|^{2}.$$

$$(40)$$

115 As for the third term of (38), from Lemma 4, we have

$$\sum_{k=1}^{K} \left(\sum_{s=1}^{k} (\sqrt{\rho})^{k-s} \sum_{j=1}^{\tau} \| h_i(\tau s + 1 - j) - h_i(\tau s - j) \| \right)^2 \\
\leq \frac{\sum_{k=1}^{K} \left(\sum_{j=1}^{\tau} \| h_i(k\tau + 1 - j) - h_i(k\tau - j) \| \right)^2}{(1 - \sqrt{\rho})^2} \\
\leq \frac{\tau \sum_{k=1}^{K} \sum_{j=1}^{\tau} \| h_i(k\tau + 1 - j) - h_i(k\tau - j) \|^2}{(1 - \sqrt{\rho})^2}.$$
(41)

Thus, from (38), (39), (41), and (40), we have

$$\sum_{t=1}^{T} \|y_i(t)\|^2 \le B_1 + \alpha^2 B_2 \sum_{t=1}^{T-1} \|h_i(t) - h_i(t-1)\|^2.$$

117 As for the term $||h_i(t) - h_i(t-1)||^2$ in above equation, from (12) and Assumption 1', we have

$$\sum_{i=2}^{N} \|h_i(t-1) - h_i(t)\|^2$$

$$\leq \sum_{i=1}^{N} \|\overline{\nabla f}(X(t))Pe(i) - \overline{\nabla f}(X(t-1))Pe(i)\|^2$$

$$= \|\overline{\nabla f}(X(t)) - \overline{\nabla f}(X(t-1))\|_F^2$$

$$= \sum_{i=1}^{N} \|\nabla f_i(x_i(t)) - \nabla f_i(x_i(t-1))\|^2$$

$$\leq L^2 \sum_{i=1}^{N} \|x_i(t) - x_i(t-1)\|^2$$

$$= L^2 \sum_{i=1}^{N} \|Y(t)P^{\mathbf{T}}e(i) - Y(t-1)P^{\mathbf{T}}e(i)\|^2$$

$$= L^2 \sum_{i=1}^{N} \|y_i(t) - y_i(t-1)\|^2.$$

The proof of Lemma 3 is completed.

3 Proof of Theorem 2

Based on our assumptions, the stochastic gradient $\nabla f_i(x,\xi_i)$ is an unbiased estimate of the accurate 120 gradient $\nabla f_i(x)$, with its variance bounded by σ^2 . Thus, we have 121

$$\mathbb{E}_{\xi_i \sim D_i}[\nabla f_i(x, \xi_i)] = \nabla f_i(x), \quad \mathbb{E}_{\xi_i \sim D_i}[\|\nabla f_i(x, \xi_i) - \nabla f_i(x)\|^2] \le \sigma^2, \tag{42}$$
 for any $x \in \mathbb{R}^n$ and $i \in \mathcal{S}$, where $\xi_i(t) \sim D_i$ are samples drawn from the local data distribution at

122 each iteration. We define 123

$$G(t) = [\nabla f_1(x_1(t), \xi_1(t)), \cdots, \nabla f_N(x_N(t), \xi_N(t))],$$

$$\overline{G}(t) = \frac{1}{N} \sum_{i=1}^{N} \nabla f_i(x_i(t), \xi_i(t)).$$

Similarly to (4), we have

$$\overline{X}(t+1) = \overline{X}(t) - \alpha \overline{G}(t).$$

From Assumption 1 and (42), we have

$$\begin{split} &\mathbb{E}[f(\overline{X}(t+1))] \\ \leq &\mathbb{E}[f(\overline{X}(t))] - \mathbb{E}\langle\nabla f(\overline{X}(t)), \alpha \overline{G}(t)\rangle + \frac{L\alpha^2}{2}\mathbb{E}\|\overline{G}(t)\|^2 \\ = &\mathbb{E}[f(\overline{X}(t))] - \alpha \mathbb{E}\langle\nabla f(\overline{X}(t)), \overline{\nabla f}(X(t))\rangle + \frac{L\alpha^2}{2}\mathbb{E}\|\overline{\nabla f}(X(t))\|^2 \end{split}$$

$$+ \frac{L\alpha^2}{2} \mathbb{E} \|\overline{G}(t) - \overline{\nabla f}(X(t))\|^2 + L\alpha^2 \mathbb{E} [\langle \overline{G}(t) - \overline{\nabla f}(X(t)), \overline{\nabla f}(X(t))\rangle]$$

$$= \mathbb{E}[f(\overline{X}(t))] - \alpha \mathbb{E}\langle \nabla f(\overline{X}(t)), \overline{\nabla f}(X(t)) \rangle$$

$$+ \frac{L\alpha^2}{2} \mathbb{E} \|\overline{\nabla f}(X(t))\|^2 + \frac{L\alpha^2}{2} \mathbb{E} \|\overline{G}(t) - \overline{\nabla f}(X(t))\|^2$$

$$\leq \mathbb{E}[f(\overline{X}(t))] - \alpha \mathbb{E}\langle \nabla f(\overline{X}(t)), \overline{\nabla f}(X(t))\rangle + \frac{L\alpha^2}{2} \mathbb{E}\|\overline{\nabla f}(X(t))\|^2$$

+
$$\frac{L\alpha^2}{2N} \sum_{i=1}^{N} \mathbb{E} \|\nabla f_i(x_i(t), \xi_i(t)) - \nabla f_i(x_i(t))\|^2$$

$$\leq \! \mathbb{E}[f(\overline{X}(t))] - \alpha \mathbb{E}\langle \nabla f(\overline{X}(t)), \overline{\nabla f}(X(t)) \rangle + \frac{L\alpha^2}{2} \mathbb{E} \| \overline{\nabla f}(X(t)) \|^2 + \frac{L\alpha^2}{2} \sigma^2$$

$$= \mathbb{E}[f(\overline{X}(t))] - \frac{\alpha}{2} \mathbb{E} \|\nabla f(\overline{X}(t))\|^2 - (\frac{\alpha}{2} - \frac{L\alpha^2}{2}) \mathbb{E} \|\overline{\nabla f}(X(t))\|^2$$

$$+ \; \frac{\alpha}{2} \mathbb{E} \| \nabla f(\overline{X}(t)) - \overline{\nabla f}(X(t)) \|^2 + \frac{L\alpha^2}{2} \sigma^2.$$

Then, we have

$$\mathbb{E}\|\nabla f(\overline{X}(t)) - \overline{\nabla f}(X(t))\|^{2}$$

$$= \mathbb{E}\|\frac{1}{N}\sum_{i=1}^{N}\nabla f_{i}(\overline{X}(t)) - \frac{1}{N}\sum_{i=1}^{N}\nabla f_{i}(x_{i}(t))\|^{2}$$

$$\leq \frac{1}{N}\sum_{i=1}^{N}\mathbb{E}\|\nabla f_{i}(\overline{X}(t)) - \nabla f_{i}(x_{i}(t))\|^{2}$$

$$\leq \frac{L^{2}}{N}\sum_{i=1}^{N}\mathbb{E}\|\overline{X}(t) - x_{i}(t)\|^{2}.$$

Thus, we have

$$\frac{\alpha}{2} \mathbb{E} \|\nabla f(\overline{X}(t))\|^{2} + \left(\frac{\alpha}{2} - \frac{L\alpha^{2}}{2}\right) \mathbb{E} \|\overline{\nabla f}(X(t))\|^{2}$$

$$\leq \mathbb{E} f(\overline{X}(t)) - \mathbb{E} f(\overline{X}(t+1)) + \frac{\alpha L^{2}}{2N} \sum_{i=1}^{N} \mathbb{E} \|\overline{X}(t) - x_{i}(t)\|^{2} + \frac{L\alpha^{2}}{2} \sigma^{2}. \tag{43}$$

Then, we need the following Lemma 5, which is proved in Appendix 3.1.

Lemma 5. We define that $B_4=1-12\alpha^2L^2B_2$ and we have

$$\begin{split} &\frac{1}{NT} \sum_{i=1}^{N} \sum_{t=1}^{T} \mathbb{E}[\|\overline{X}(t) - x_i(t)\|^2] \\ \leq &\frac{C_2}{B_4 N T} + \frac{6\alpha^4 L^2 B_2}{B_4 T} \sum_{t=1}^{T-1} \mathbb{E}[\|\overline{\nabla f}(X(t))\|^2] + \frac{12B_2}{B_4} \alpha^2 \sigma^2, \end{split}$$

130 where $C_2=6\alpha^2L^2NB_2(\alpha^2\mathbb{E}[\|\overline{\nabla f}(X(0))\|^2]+A_5^2)+NB_1$ and $A_5=2\mathbb{E}[\|X(1)\|^2]+131-2\mathbb{E}[\|X(0)\|^2].$

From (43) and Lemma 5, we have

$$\begin{split} & \sum_{t=1}^{T} \left\{ \mathbb{E} \| \nabla f(\overline{X}(t)) \|^{2} + (1 - L\alpha) \mathbb{E} \| \overline{\nabla f}(X(t)) \|^{2} \right\} \\ & \leq \frac{2}{\alpha} \left\{ \mathbb{E} [f(\overline{X}(1))] - f(x^{*}) \right\} + L\alpha \sigma^{2} T + \frac{L^{2}}{N} \sum_{t=1}^{T} \sum_{i=1}^{N} \mathbb{E} \| \overline{X}(t) - x_{i}(t) \|^{2} \\ & \leq \frac{2}{\alpha} \left\{ \mathbb{E} [f(\overline{X}(1))] - f(x^{*}) \right\} + L\alpha \sigma^{2} T + \frac{C_{2}L^{2}}{B_{4}N} \\ & + \frac{12B_{2}L^{2}}{B_{4}} \alpha^{2} \sigma^{2} T + \frac{6\alpha^{4}L^{4}B_{2}}{B_{4}} \sum_{t=1}^{T-1} \mathbb{E} [\| \overline{\nabla f}(X(t)) \|^{2}]. \end{split}$$

133 If the stepsize $0<\alpha\leq\frac{1}{\sqrt{13B_2}L}$, we have $B_4\geq\alpha^2L^2B_2$ and $1-L\alpha-\frac{6\alpha^4L^4B_2}{B_4}>0$. Thus, we have

$$\frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \|\nabla f(\overline{X}(t))\|^{2} \le \frac{2}{\alpha T} \{\mathbb{E} f(\overline{X}(1)) - f(x^{*})\}
+ \frac{C_{2}L^{2}}{B_{4}NT} + L\alpha\sigma^{2} + \frac{12B_{2}}{1 - 12\alpha^{2}L^{2}B_{2}}\alpha^{2}L^{2}\sigma^{2}.$$
(44)

Thus, we need to analyze the term $\frac{C_2L^2}{B_3NT}$, which satisfies

$$\frac{C_{2}L^{2}}{B_{4}N\tau K}$$

$$\leq \frac{6\alpha^{2}L^{4}B_{2}(\alpha^{2}\mathbb{E}[\|\overline{\nabla f}(X(0))\|^{2}] + A_{5}^{2}) + B_{1}L^{2}}{B_{4}\tau K}$$

$$\leq \frac{6\alpha^{4}L^{4}B_{2}\mathbb{E}[\|\overline{\nabla f}(X(0))\|^{2}]}{B_{4}\tau K} + \frac{6\alpha^{2}L^{4}B_{2}A_{5}^{2}}{B_{4}\tau K} + \frac{B_{1}L^{2}}{B_{4}\tau K}$$

$$\leq \frac{6\mathbb{E}[\|\overline{\nabla f}(X(0))\|^{2}]}{\tau^{3}K} + \frac{12\mathbb{E}[\|X(1)\|_{F}^{2}] + 12\mathbb{E}[\|X(0)\|_{F}^{2}]}{\tau^{3}\alpha^{2}K} + \frac{B_{1}L^{2}}{B_{4}\tau K}.$$
(45)

Similar to (35), we have

$$\frac{B_1}{B_4} \leq \frac{1}{\alpha^2 L^2} \frac{B_1}{B_2}
\leq \frac{1}{\alpha^2 L^2} \frac{2(1 - \sqrt{\rho})^2 \tau(\tau + 1)(2\tau + 1) A_4^2 A_2^2}{2(1 - \rho)\rho^2 \tau^4 (\tau + 1)(2\tau + 1) A_4^2}
\leq \frac{2\mathbb{E}[\|X(0)\|_F^2] + 2\mathbb{E}[\|X(0)\|^2]}{\alpha^2 L^2 \rho^2 \tau^3}.$$
(46)

In addition, from $0 < \alpha \le \frac{1}{\sqrt{13B_2}L}$, we have

$$1 - 12\alpha^2 B_2 L^2 \ge \frac{1}{13}. (47)$$

138 Thus, from (44), (45), (46), and (47), we have

$$\begin{split} &\frac{1}{T} \sum_{t=1}^{T} \mathbb{E} \| \nabla f(\overline{X}(t)) \|^2 \\ \leq &\frac{2 \mathbb{E}[f(\overline{X}(1))] - 2 f(x^*)}{\alpha \tau K} + \frac{2 \mathbb{E}[\|X(1)\|_F^2] + 2 \mathbb{E}[\|X(0)\|_F^2]}{\alpha^2 \rho^2 \tau^4 K} + \frac{6 \mathbb{E}[\|\overline{\nabla f}(X(0))\|^2]}{\tau^3 K} \\ &+ \frac{12 \mathbb{E}[\|X(1)\|_F^2] + 12 \mathbb{E}[\|X(0)\|_F^2]}{\tau^3 \alpha^2 K} + L \alpha \sigma^2 + 156 B_2 \alpha^2 L^2 \sigma^2. \end{split}$$

The proof of Theorem 2 is completed.

140 **3.1 Proof of Lemma 5**

141 Similar to Lemma 3, we have

$$\sum_{t=1}^{T} \|y_i(t)\|^2 \le B_1 + \alpha^2 B_2 \sum_{t=1}^{T-1} \|h_i(t) - h_i(t-1)\|^2, \tag{48}$$

142 where

$$B_2 = 3\tau^4 + \frac{\tau^2(\tau+1)(2\tau+1)(\rho\tau+\tau-1)^2 A_4^2}{2(1-\sqrt{\rho})^2}$$

$$B_1 = \frac{\tau(\tau+1)(2\tau+1)A_4^2 A_2^2}{2(1-\rho)}.$$

143 In addition, we have

$$\sum_{i=2}^{N} \mathbb{E}[\|h_{i}(t) - h_{i}(t-1)\|^{2}]$$

$$\leq \sum_{i=1}^{N} \mathbb{E}[\|G(t)Pe(i) - G(t-1)Pe(i)\|^{2}]$$

$$= \mathbb{E}[\|G(t) - G(t-1)\|_{F}^{2}]$$

$$\leq 3 \sum_{i=1}^{N} \mathbb{E}[\|\nabla f_{i}(x_{i}(t-1), \xi_{i}(t-1)) - \nabla f_{i}(x_{i}(t-1))\|^{2}]$$

$$+ 3 \sum_{i=1}^{N} \mathbb{E}[\|\nabla f_{i}(x_{i}(t), \xi_{i}(t)) - \nabla f_{i}(x_{i}(t))\|^{2}] + 3 \sum_{i=1}^{N} \mathbb{E}[\|\nabla f_{i}(x_{i}(t)) - \nabla f_{i}(x_{i}(t-1))\|^{2}]$$

$$\leq 6\sigma^{2}N + 3L^{2} \sum_{i=1}^{N} \mathbb{E}[\|x_{i}(t) - x_{i}(t-1)\|^{2}]$$

$$= 6\sigma^{2}N + 3L^{2} \mathbb{E}[\|Y(t)P^{T} - Y(t-1)P^{T}\|_{F}^{2}]$$

$$= 6\sigma^{2}N + 3L^{2} \sum_{i=1}^{N} \mathbb{E}[\|y_{i}(t) - y_{i}(t-1)\|^{2}]. \tag{49}$$

144 From (48) and (49), we have

$$\sum_{i=2}^{N} \sum_{t=1}^{T} \mathbb{E}[\|y_i(t)\|^2] \le NB_1 + 3\alpha^2 L^2 B_2 \sum_{t=1}^{T-1} \sum_{i=1}^{N} \mathbb{E}[\|y_i(t) - y_i(t-1)\|^2] + 6\alpha^2 NB_2 \sigma^2 T. \quad (50)$$

We already have

$$y_1(t) = X(t)Pe_1 = X(t)v_1 = \sqrt{NX}(t).$$

145 In addition, we have

$$\|\overline{X}(t+1) - \overline{X}(t)\|^{2} \le 2\alpha^{2} \|\overline{G}(t) - \overline{\nabla}f(X(t))\|^{2} + 2\alpha^{2} \|\overline{\nabla}f(X(t))\|^{2}$$

$$\le 2\alpha^{2} \|\frac{1}{N} \sum_{i=1}^{N} \nabla f_{i}(x_{i}(t), \xi_{i}(t)) - \frac{1}{N} \sum_{i=1}^{N} \nabla f_{i}(x_{i}(t))\|^{2} + 2\alpha^{2} \|\overline{\nabla}f(X(t))\|^{2}$$

$$\le 2\alpha^{2}\sigma^{2} + 2\alpha^{2}\mathbb{E}[\|\overline{\nabla}f(X(t))\|^{2}].$$
(51)

Thus, from (51), we have

$$\mathbb{E}[\|y_1(t+1) - y_1(t)\|^2] \le 2\alpha^2 N\sigma^2 + 2\alpha^2 N \mathbb{E}[\|\overline{\nabla f}(X(t))\|^2]. \tag{52}$$

147 From (50) and (52), we have

$$\sum_{i=2}^{N} \sum_{t=1}^{T} \mathbb{E}[\|y_{i}(t)\|^{2}]$$

$$\leq NB_{1} + 3\alpha^{2}L^{2}B_{2} \sum_{t=1}^{T-1} \sum_{i=2}^{N} \mathbb{E}[\|y_{i}(t) - y_{i}(t-1)\|^{2}]$$

$$+ 3\alpha^{2}L^{2}B_{2} \sum_{t=1}^{T-1} \{2\alpha^{2}N\sigma^{2} + 2\alpha^{2}N\mathbb{E}[\|\overline{\nabla f}(X(t-1))\|^{2}]\} + 6\alpha^{2}NB_{2}\sigma^{2}T$$

$$\leq NB_{1} + 6\alpha^{2}L^{2}B_{2} \sum_{t=1}^{T-1} \sum_{i=2}^{N} \mathbb{E}[\|y_{i}(t)\|^{2} + \|y_{i}(t-1)\|^{2}]$$

$$+ 6\alpha^{4}L^{2}B_{2}N \sum_{t=1}^{T-1} \mathbb{E}[\|\overline{\nabla f}(X(t-1))\|^{2}] + 12B_{2}N\alpha^{2}\sigma^{2}T.$$

Thus, from (15), we have

$$(1 - 12\alpha^{2}L^{2}B_{2}) \sum_{i=1}^{N} \sum_{t=1}^{T} \mathbb{E}[\|\overline{X}(t) - x_{i}(t)\|^{2}]$$

$$\leq C_{2} + 6\alpha^{4}L^{2}B_{2}N \sum_{t=1}^{T-1} \mathbb{E}[\|\overline{\nabla f}(X(t))\|^{2}] + 12B_{2}N\alpha^{2}\sigma^{2}T.$$

where $C_2 = 6\alpha^2 L^2 N B_2(\alpha^2 \mathbb{E}[\|\overline{\nabla f}(X(0))\|^2] + A_5^2) + N B_1$ and $A_5 = \max_{i=2,3,\cdots,N} \{\mathbb{E}[\|y_i(1)\|] + \mathbb{E}[\|y_i(0)\|]\}$. Moreover, we define $B_4 = 1 - 12\alpha^2 L^2 B_2$ and the proof of Lemma 5 is completed.
